Installation

Mounting:

Usually, the actuator has to be mounted and supported as shown in the picture to the left. Exceptionally, and only if the application is vibration free and the tubing is minimum ¼” dia. stainless, the actuator may be suspended on the tubing itself.
Wiring:

The actuator comes standard with a Turck 5 position connector and a 20' cable with plug. Cut the cable to the length required and then connect according to the following wire color schematic:

<table>
<thead>
<tr>
<th>Pin</th>
<th>Colour</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>White</td>
<td>+24VDC</td>
</tr>
<tr>
<td>5</td>
<td>Black</td>
<td>Power Gnd.</td>
</tr>
<tr>
<td>4</td>
<td>Grey</td>
<td>Output Signal (4..20mA)*</td>
</tr>
<tr>
<td>3</td>
<td></td>
<td>Not connected</td>
</tr>
<tr>
<td>2</td>
<td>Brown</td>
<td>Isolated** Input Signal Gnd.</td>
</tr>
<tr>
<td>1</td>
<td>Blue</td>
<td>Isolated** Input + Signal (4..20mA)</td>
</tr>
</tbody>
</table>

* “feedback” available in MCx-xxxAF version of actuator only.

** “isolated” available in MCx-xxxAI and xxxAF versions of actuator only.

Otherwise, if the Turck cable is not included in your actuator, see pg.9 for more detailed wiring instructions.

Connect the power:

The **MCx** may be connected to voltages ranging from: 12 – 24 VDC.

The power consumption will range from max. 3.0A to approx. min. 100mA when the actuator is active. When not moving, the actuator draws around 50mA.

Remove R66 to convert to 1 .. 5V input signal.
Connect the signal:

Locate the correct connection terminals as shown on the previous page, then connect your input signal on pos. 1 and 2 as shown below. Feedback, if applicable is connected to position 4.

**4..20mA Signal source,**

**user powered**

**NOTE 1:** Usually, the actuators are shipped for 4..20mA signal input.

For 1..5 V signal input, remove 250 ohm resistor R66.

**NOTE 2:** Signal Gnd. is **NOT ISOLATED** from Power Gnd. in all MCx-xxxAB basic models.

If your signal Gnd. is different from Power Gnd. use HANBAY MCx-xxxAI or MCx-xxxAF model actuators.

**NOTE 3:** **DO NOT CONNECT** pin 4 directly or through a multimeter only to ground. A sensing resistor of 50 ohms or more needs to be present. Not observing this warning will damage the equipment.

The actuator 4..20 mA output is internally supplying the signal current and can drive sufficient voltage for any sensing resistor of up to 250 ohms.

The potential of the external GND after the sensing resistor may not be more than +6VDC / -2 VDC away from the power GND of the actuator.

This feedback signal output is only available in HANBAY MCx-xxxAF model actuators.
Operation

DIP switches:

The DIP switches allow you to change the settings on your actuator. To flip a switch, gently use a small flat-head screwdriver. See chart on next page for DIP switch functionality.

In this example DIPS 1, 2, 6 and 12 are on.

<td></td>
</tr>
<tr>
<td>12</td>
<td>Direction/Calibration: Toggle switch on and off while powered to re-calibrate actuator. Also sets direction in which the actuator will open and close. See pg. 5-6. Example: The MCM model actuator turns clockwise when the signal is decreased with DIP 12 in the OFF position. For changes to rotation to take affect flip the switch and cycle the power to the actuator.</td>
</tr>
</tbody>
</table>
Torque Settings:

To accommodate different valves and other applications with different torque requirements, the actuator can be set to apply different torque on the valve stem when in the seating mode. Please see the box to the right and the tables on pg. 7-8 to select the power setting that is right for your application. The actuator will try to reach the speed set by DIP 1 and DIP 2. It will use 100% of available torque to try and reach the selected speed. Current drawn will be limited proportionally to the DIP setting applied actuator will automatically slow down and deliver the maximum available torque for a given “Permanent Power Setting”.

To deal with sticking valves, at the beginning of the first reversing movement after the seating (“zeroing”) of the valve, the actuator will apply double the power set by DIP 10 and Dip 11 (up to 100% power.) This “pull out” function is always enabled.

⚠️ **Warning:** High power settings can supply enough torque to damage your valve. Please be cautious, especially when using the 100% power setting.

### Signal Loss and Calibration:

1. **For actuators that are not connected to a UPS** (Uninterruptible Power Supply), the loss of signal will be simultaneous with power loss. As a consequence, the actuator will not be able to move anywhere. In the shutdown process though, the actual position is automatically saved to the internal EEPROM. [this saving of the position is only happening for min. 18VDC supplies]

   When power is restored, the actuator will “know” its location and will simply start to follow the signal as received.

   **IF YOU HAVE TO** turn the actuator manually when its power is turned off, it will lose its position, and it will need to be re–zeroed (as described in section 3 on the following page).

2. **For actuators that are connected to a UPS** the behavior on signal loss can be set as follows:

#### Normal position of DIP 9: OFF

With DIP 9 in the off position, the actuator will ignore the signal if it is lost (i.e.: if the signal falls below 0.7V or 2.8mA) and simply remain in its current position.

**Note:** if the sensing resistor R66 is removed (for 1..5V input signals), we recommend placing a 10K resistor between signal and signal GND.

#### Predetermined signal loss position DIP 9: ON

With DIP 9 in the on position, the actuator will move to a predetermined position when the signal is lost (i.e.: if the signal falls below 2.8mA or 0.7V).

Setting of the predetermined signal loss position:

- a. - turn DIP 9 to the “off” position
- b. - re – zero the actuator by sending and holding an input signal between 2.8 and 4.16 mA (0.7 to 1.04V) wait until the device is re-zeroed, (i.e.: the valve is closed)
- c. - by varying the input signal, move the actuator to the position that is going to be the predetermined signal loss position.
- d. - switch DIP 9 to the “on” position. The current actuator position will be saved as the default signal loss position. (The default signal position is an absolute actuator position. i.e.: not a signal value.)
3. - **Re – Zeroing the actuator and initiating calibration routine:**
   The actuator will re-zero when the input signal is between 2.8 and 4.16mA (0.700V – 1.040V). It will turn clockwise until the actuator has reached the fully closed position of the valve.

   **Different valves mounted to actuator need the calibration routine initiated manually.** This is done by toggling DIP 12 in the one way and back to its original position while the actuator is powered. This will initiate the calibration routine and is essential when changes have been made to the valve.

   **If you need to re-zero in the opposite direction** (i.e.: for pressure regulators, which typically go to the “top” fully open position at 4mA) change the setting of DIP 12 and cycle power.

4. - **Feedback calibration: [MCx-xxxAF model actuators only]**
   The current feedback will be calibrated from the factory.
   To re-calibrate the feedback:
   a.- Turn off the actuator, and disconnect the feedback and input signals. If possible, remove from the valve.
   b.- Connect the feedback signal to the signal input (Terminal strip #1 BLUE to #4 GRAY. Also re-connect the power and signal grounds (terminals 5 & 6).
   c.- Power up the actuator with this “signal loop-back” setup.
   d.- Short SP1 on the circuit board. It will automatically run a special routine to calibrate the feedback signal to the signal input.
   e.- Turn off the power and reconnect the actuator as normal.

**Troubleshooting:**

Upon noticing a problem, your first step should almost always be to recalibrate the actuator by switching DIP 12, then switching it back to its original position, all while the actuator is powered. This alone can solve basic problems. See section 3 on this page for more details.

**If the actuator does not move, try following these steps:**
1) Re-calibrate the actuator. This will move the actuator regardless of what signal it is receiving.
2) A sticking valve may be the problem. Remove the valve from the actuator, and re-test the actuator.
3) Remove power. Re-check the wiring and the power/signal apparatus. Power actuator, and re-calibrate.
   If the problem persists, please call Hanbay for technical support.
Appendix

Changing the number of turns:

The 4 .. 20mA (or 1 .. 5V) input signal represents a total span of a number of turns. i.e.: If you set the number of turns to 2, then a signal of 12mA will set the actuator to exactly 1 turn from the fully closed position. 15 mA will give:  (15-4)/16=0.6875  =>  68.75% of 2 turns  =>  1.375 turns from closed etc.

With the DIP switch settings, you can adjust anything between 1 and 31 turns to represent the full signal range of 4 .. 20mA. Check in the table below. (1 = “On”  0 = “Off”)

<table>
<thead>
<tr>

</tbody>
</table>

For more turns set DIP 4 as follows:

- DIP 4=0  0  This will add 16 turns to the function of DIPs 5 to 8
- DIP 4=1  +16 turns

WARNING: Be sure that the number of turns the actuator is set for is LESS than the number of turns for the valve. The actuator should not stop itself on a fully opened valve. It can damage the valve, and the actuator will lose its position.

Speed and Torque Details:

The maximum speed of the actuator can be set by using the first two positions of the DIP switch selector. As a result of this setting, the actuator will limit the maximum speed. The tables below show the maximum torques that can be expected at the given maximum speeds.

The torque available also depends on the voltage provided in the power connection and on the seating power settings on DIP 10, 11 as shown below.

NOTE: If actuator is MCJ-xxxAx, divide torque values by 3.

Speed and Torque of MCL-xxxAx Actuators

| DIP 1 | DIP 2 | Time for 1 turn (sec) | Torque in in-lbs 16% Power* Torque in in-lbs 33% Power* Torque in in-lbs 66% Power* Torque in in-lbs 100% Power* |
|-------|-------|-----------------------|-----------------|----------------|----------------|----------------|----------------|----------------|
| OFF   | OFF   | 7                     | 12VDC 9         | 24VDC 18       | 12VDC 12       | 24VDC 24       | 12VDC 30       | 24VDC 60       |

</tbody>
</table>

Operating torque is 100%. These torque values are for valve seating.

To convert in-lbs to Nm, divide the in-lbs value by 9

---

**Note:** 66% setting and 100% setting require voltage supply minimum values as follows:
- Supply voltage needs to be min 14 VDC for 66% setting
- Supply voltage needs to be 16 VDC for 100% setting
- When operating above 20VDC and 66% power, Duty cycle is reduced to 50% - 25% maximum.
  
  At these levels, the electronics produce more heat which must be dissipated (depending on environmental temperature)

**Note:** Digital potentiometer functionality is disabled for supply voltages below 18VDC, so the actuator position will not be retained on power-loss, on power-up the actuator will need to be re-zeroed every time.
Main Dimensions:

Cable Installation:

Select a connection cable with 5 leads.

The liquid tight strain relief on the base of the actuator is designed to accommodate a cable of O.D. 2.5 - 6.5mm (0.10 - 0.26in). Be sure to not use a cable with an OD that is no bigger than this!

1. Remove the liquid tight fitting from the actuator casing and insert the cable into it.
2. The cable has to be stripped of its jacket for 2 inches (50mm) and the wires need 1/8" (3mm) stripped ends.
3. Bend the wires so that insertion becomes easy.
4. Carefully insert the cable into the actuator base. Mind the red motor cable and its plug into the board. Moving the plug out of its fully inserted position may cause malfunction of the actuator.
5. Put the liquid tight fitting back and tighten (lightly with tool).
6. Hand tighten the liquid tight fitting to establish seal.
7. Connect wires according to your application (see page 2,3).
8. Mount actuator cover and tighten 4 screws.
